

**APPENDIX:**

The Appendix includes the following item(s):

- ☒ - a new or amended Abstract of the Disclosure

ABSTRACT OF THE DISCLOSURE

A method for detecting a passage associated with an access door, for example a boarding door or a building entrance, which is secured in order to ensure passage of a single person includes producing the profile of an entering person by a first level detection device formed by the vertical bars of active infrared cells (D1), and opening or holding closed the access door according to the profile.
